

TCA9548A Low-Voltage 8-Channel I²C Switch with Reset

1 Features

- 1-to-8 Bidirectional Translating Switches
- I²C Bus and SMBus Compatible
- Active-Low Reset Input
- Three Address Pins, Allowing up to Eight TCA9548A Devices on the I²C Bus
- Channel Selection Through an I²C Bus, In Any Combination
- Power Up With All Switch Channels Deselected
- Low R_{ON} Switches
- Allows Voltage-Level Translation Between 1.8-V, 2.5-V, 3.3-V, and 5-V Buses
- No Glitch on Power Up
- Supports Hot Insertion
- Low Standby Current
- Operating Power-Supply Voltage Range of 1.65 V to 5.5 V
- 5-V Tolerant Inputs
- 0- to 400-kHz Clock Frequency
- Latch-Up Performance Exceeds 100 mA Per JESD 78, Class II
- ESD Protection Exceeds JESD 22
 - ±2000-V Human-Body Model (A114-A)
 - 200-V Machine Model (A115-A)
 - ±1000-V Charged-Device Model (C101)

2 Applications

- Servers
- Routers (Telecom Switching Equipment)
- Factory Automation
- Products With I²C Slave Address Conflicts (Such as Multiple, Identical Temperature Sensors)

3 Description

The TCA9548A device has eight bidirectional translating switches that can be controlled through the I²C bus. The SCL/SDA upstream pair fans out to eight downstream pairs, or channels. Any individual SC_n/SD_n channel or combination of channels can be selected, determined by the contents of the programmable control register. These downstream channels can be used to resolve I²C slave address conflicts. For example, if eight identical digital temperature sensors are needed in the application, one sensor can be connected at each channel: 0-7.

The system master can reset the TCA9548A in the event of a time-out or other improper operation by asserting a low in the **RESET** input. Similarly, the power-on reset deselects all channels and initializes the I²C/SMBus state machine. Asserting **RESET** causes the same reset and initialization to occur without powering down the part. This allows recovery should one of the downstream I²C buses get stuck in a low state.

The pass gates of the switches are constructed so that the VCC pin can be used to limit the maximum high voltage, which is passed by the TCA9548A. Limiting the maximum high voltage allows the use of different bus voltages on each pair, so that 1.8-V, 2.5-V or 3.3-V parts can communicate with 5-V parts, without any additional protection. External pullup resistors pull the bus up to the desired voltage level for each channel. All I/O pins are 5-V tolerant.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TCA9548A	TSSOP (24)	7.80 mm × 4.40 mm
	VQFN (24)	4.00 mm × 4.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision E (October 2015) to Revision F	Page
• Updated the Description section.....	1
• Added new orderable part number, TCA9548AMRGER.....	1
Changes from Revision D (January 2015) to Revision E	Page
• Updated Pin Functions table.	3
• Added new I ² C Sections and read/write description	15
Changes from Revision C (November 2013) to Revision D	Page
• Added <i>Pin Configuration and Functions</i> section, <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section	1
• Updated Typical Application schematic.	20
Changes from Revision B (November 2013) to Revision C	Page
• Updated V _{POR} and I _{CC} standby specification.	5
Changes from Revision A (July 2012) to Revision B	Page
• Updated document formatting.	1
• Removed ordering information.	1

5 Pin Configuration and Functions

Pin Functions

NAME	PIN		TYPE	DESCRIPTION
	TSSOP (PW)	QFN (RGE)		
A0	1	22	I	Address input 0. Connect directly to V _{CC} or ground
A1	2	23	I	Address input 1. Connect directly to V _{CC} or ground
A2	21	18	I	Address input 2. Connect directly to V _{CC} or ground
GND	12	9	—	Ground
$\overline{\text{RESET}}$	3	24	I	Active-low reset input. Connect to V _{CC} or V _{DPUM} ⁽¹⁾ through a pull-up resistor, if not used
SD0	4	1	I/O	Serial data 0. Connect to V _{DPU0} ⁽¹⁾ through a pull-up resistor
SC0	5	2	I/O	Serial clock 0. Connect to V _{DPU0} ⁽¹⁾ through a pull-up resistor
SD1	6	3	I/O	Serial data 1. Connect to V _{DPU1} ⁽¹⁾ through a pull-up resistor
SC1	7	4	I/O	Serial clock 1. Connect to V _{DPU1} ⁽¹⁾ through a pull-up resistor
SD2	8	5	I/O	Serial data 2. Connect to V _{DPU2} ⁽¹⁾ through a pull-up resistor
SC2	9	6	I/O	Serial clock 2. Connect to V _{DPU2} ⁽¹⁾ through a pull-up resistor
SD3	10	7	I/O	Serial data 3. Connect to V _{DPU3} ⁽¹⁾ through a pull-up resistor
SC3	11	8	I/O	Serial clock 3. Connect to V _{DPU3} ⁽¹⁾ through a pull-up resistor
SD4	13	10	I/O	Serial data 4. Connect to V _{DPU4} ⁽¹⁾ through a pull-up resistor
SC4	14	11	I/O	Serial clock 4. Connect to V _{DPU4} ⁽¹⁾ through a pull-up resistor
SD5	15	12	I/O	Serial data 5. Connect to V _{DPU5} ⁽¹⁾ through a pull-up resistor
SC5	16	13	I/O	Serial clock 5. Connect to V _{DPU5} ⁽¹⁾ through a pull-up resistor
SD6	17	14	I/O	Serial data 6. Connect to V _{DPU6} ⁽¹⁾ through a pull-up resistor
SC6	18	15	I/O	Serial clock 6. Connect to V _{DPU6} ⁽¹⁾ through a pull-up resistor
SD7	19	16	I/O	Serial data 7. Connect to V _{DPU7} ⁽¹⁾ through a pull-up resistor
SC7	20	17	I/O	Serial clock 7. Connect to V _{DPU7} ⁽¹⁾ through a pull-up resistor
SCL	22	19	I/O	Serial clock bus. Connect to V _{DPUM} ⁽¹⁾ through a pull-up resistor
SDA	23	20	I/O	Serial data bus. Connect to V _{DPUM} ⁽¹⁾ through a pull-up resistor
VCC	24	21	Power	Supply voltage

(1) V_{DPUX} is the pull-up reference voltage for the associated data line. V_{DPUM} is the master I²C reference voltage and V_{DPU0}–V_{DPU7} are the slave channel reference voltages.

6 Specifications

6.1 Absolute Maximum Ratings⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V _{CC}	Supply voltage	−0.5	7	V
V _I	Input voltage ⁽²⁾	−0.5	7	V
I _I	Input current	−20	20	mA
I _O	Output current	−25		mA
I _{CC}	Supply current	−100	100	mA
T _{stg}	Storage temperature	−65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The input negative-voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

		MIN	MAX	UNIT
V _{CC}	Supply voltage	1.65	5.5	V
V _{IH}	High-level input voltage	SCL, SDA	6	V
		A2–A0, $\overline{\text{RESET}}$	$0.7 \times V_{CC}$	
V _{IL}	Low-level input voltage	SCL, SDA	$0.3 \times V_{CC}$	V
		A2–A0, $\overline{\text{RESET}}$	$0.3 \times V_{CC}$	
T _A	Operating free-air temperature	−40	85	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TCA9548A		UNIT
		PW (TSSOP)	RGE (VQFN)	
		24 PINS	24 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	108.8	57.2	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	54.1	62.5	°C/W
R _{θJB}	Junction-to-board thermal resistance	62.7	34.4	°C/W
ψ _{JT}	Junction-to-top characterization parameter	10.9	3.8	°C/W
ψ _{JB}	Junction-to-board characterization parameter	62.3	34.4	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	N/A	15.5	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics⁽¹⁾

$V_{CC} = 2.3 \text{ V to } 3.6 \text{ V}$, over recommended operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V_{CC}	MIN	TYP ⁽²⁾	MAX	UNIT
V_{PORR}	Power-on reset voltage, V_{CC} rising	No load, $V_I = V_{CC}$ or GND ⁽³⁾		1.2		1.5	V
V_{PORF}	Power-on reset voltage, V_{CC} falling ⁽⁴⁾	No load, $V_I = V_{CC}$ or GND ⁽³⁾		0.8	1		V
$V_{O(SW)}$	Switch output voltage	$V_{I(SW)} = V_{CC}$, $I_{SWout} = -100 \mu\text{A}$	5 V		3.6		V
			4.5 V to 5.5 V	2.6		4.5	
			3.3 V		1.9		
			3 V to 3.6 V	1.6		2.8	
			2.5 V		1.5		
			2.3 V to 2.7 V	1.1		2	
			1.8 V		1.1		
			1.65 V to 1.95 V	0.9		1.25	
I_{OL}	SDA	$V_{OL} = 0.4 \text{ V}$	1.65 V to 5.5 V	3		6	mA
		$V_{OL} = 0.6 \text{ V}$		6		9	
I_I	SCL, SDA	$V_I = V_{CC}$ or GND ⁽³⁾	1.65 V to 5.5 V	-1		1	μA

	RESET			-1		1	
I_{CC}	Operating mode	$f_{SCL} = 400 \text{ kHz}$	5.5 V		50	80	μA
			3.6 V		20	35	
			2.7 V		11	20	
			1.65 V		6	10	
		$f_{SCL} = 100 \text{ kHz}$	5.5 V		9	30	
			3.6 V		6	15	
			2.7 V		4	8	
			1.65 V		2	4	
	Standby mode	Low inputs	5.5 V		0.2	2	
			3.6 V		0.1	2	
			2.7 V		0.1	1	
			1.65 V		0.1	1	
		High inputs	5.5 V		0.2	2	
			3.6 V		0.1	2	
			2.7 V		0.1	1	
			1.65 V		0.1	1	
ΔI_{CC}	Supply-current change	SCL, SDA	1.65 V to 5.5 V		3	20	μA
					3	20	
C_i	A2–A0	$V_I = V_{CC}$ or GND ⁽³⁾	1.65 V to 5.5 V		4	5	pF
	RESET				4	5	
	SCL	$V_I = V_{CC}$ or GND ⁽³⁾ , Switch OFF			20	28	
$C_{iO(off)}$ ⁽⁵⁾	SDA	$V_I = V_{CC}$ or GND ⁽³⁾ , Switch OFF	1.65 V to 5.5 V		20	28	pF
	SC7–SC0, SD7–SD0				5.5	7.5	

(1) For operation between specified voltage ranges, refer to the worst-case parameter in both applicable ranges.

(2) All typical values are at nominal supply voltage (1.8-, 2.5-, 3.3-, or 5-V V_{CC}), $T_A = 25^\circ\text{C}$.

(3) RESET = V_{CC} (held high) when all other input voltages, $V_I = \text{GND}$.

(4) The power-on reset circuit resets the I²C bus logic with $V_{CC} < V_{PORF}$.

(5) $C_{iO(ON)}$ depends on internal capacitance and external capacitance added to the SCn lines when channels(s) are ON.

Electrical Characteristics⁽¹⁾ (continued)

$V_{CC} = 2.3 \text{ V to } 3.6 \text{ V}$, over recommended operating free-air temperature range (unless otherwise noted)

t_{sts}	I ² C start or repeated start condition setup		4.7		μs
t_{sth}	I ² C start or repeated start condition hold		4		μs
t_{sps}	I ² C stop condition setup		4		μs
$t_{vdL(Data)}$	Valid-data time (high to low) ⁽²⁾	SCL low to SDA output low valid		1	μs
$t_{vdH(Data)}$	Valid-data time (low to high) ⁽²⁾	SCL low to SDA output high valid		0.6	μs
$t_{vd(ack)}$	Valid-data time of ACK condition	ACK signal from SCL low to SDA output low		1	μs
C_b	I ² C bus capacitive load			400	pF
FAST MODE					
f_{scl}	I ² C clock frequency		0	400	kHz
t_{sch}	I ² C clock high time		0.6		μs
t_{scl}	I ² C clock low time		1.3		μs
t_{sp}	I ² C spike time			50	ns
t_{sds}	I ² C serial-data setup time		100		ns
t_{sdh}	I ² C serial-data hold time		0 ⁽¹⁾		μs
t_{icr}	I ² C input rise time		$20 + 0.1C_{(3)}$	300	ns
t_{icf}	I ² C input fall time		$20 + 0.1C_{(3)}$	300	ns
t_{ocf}	I ² C output (SDn) fall time (10-pF to 400-pF bus)		$20 + 0.1C_{(3)}$	300	ns
t_{buf}	I ² C bus free time between stop and start		1.3		μs
t_{sts}	I ² C start or repeated start condition setup		0.6		μs
t_{sth}	I ² C start or repeated start condition hold		0.6		μs
t_{sps}	I ² C stop condition setup		0.6		μs

(1) A device internally must provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IH} min of the SCL signal), to bridge the undefined region of the falling edge of SCL.

(2) Data taken using a 1-k Ω pull-up resistor and 50-pF load (see [Figure 6](#))

(3) C_b = total bus capacitance of one bus line in pF

I²C Interface Timing Requirements (continued)

over recommended operating free-air temperature range (unless otherwise noted) (see [Figure 5](#))

			MIN	MAX	UNIT
$t_{vdL(Data)}$	Valid-data time (high to low) ⁽²⁾	SCL low to SDA output low valid		1	μs
$t_{vdH(Data)}$	Valid-data time (low to high) ⁽²⁾	SCL low to SDA output high valid		0.6	μs
$t_{vd(ack)}$	Valid-data time of ACK condition	ACK signal from SCL low to SDA output low		1	μs
C_b	I ² C bus capacitive load			400	pF

6.7 Reset Timing Requirements

over recommended operating free-air temperature range (unless otherwise noted)

PARAMETER			MIN	MAX	UNIT
$t_{W(L)}$	Pulse duration, \overline{RESET} low		6		ns
$t_{REC(STA)}$	Recovery time from \overline{RESET} to start		0		ns

6.8 Switching Characteristics

over recommended operating free-air temperature range, $C_L \leq 100$ pF (unless otherwise noted) (see [Figure 5](#))

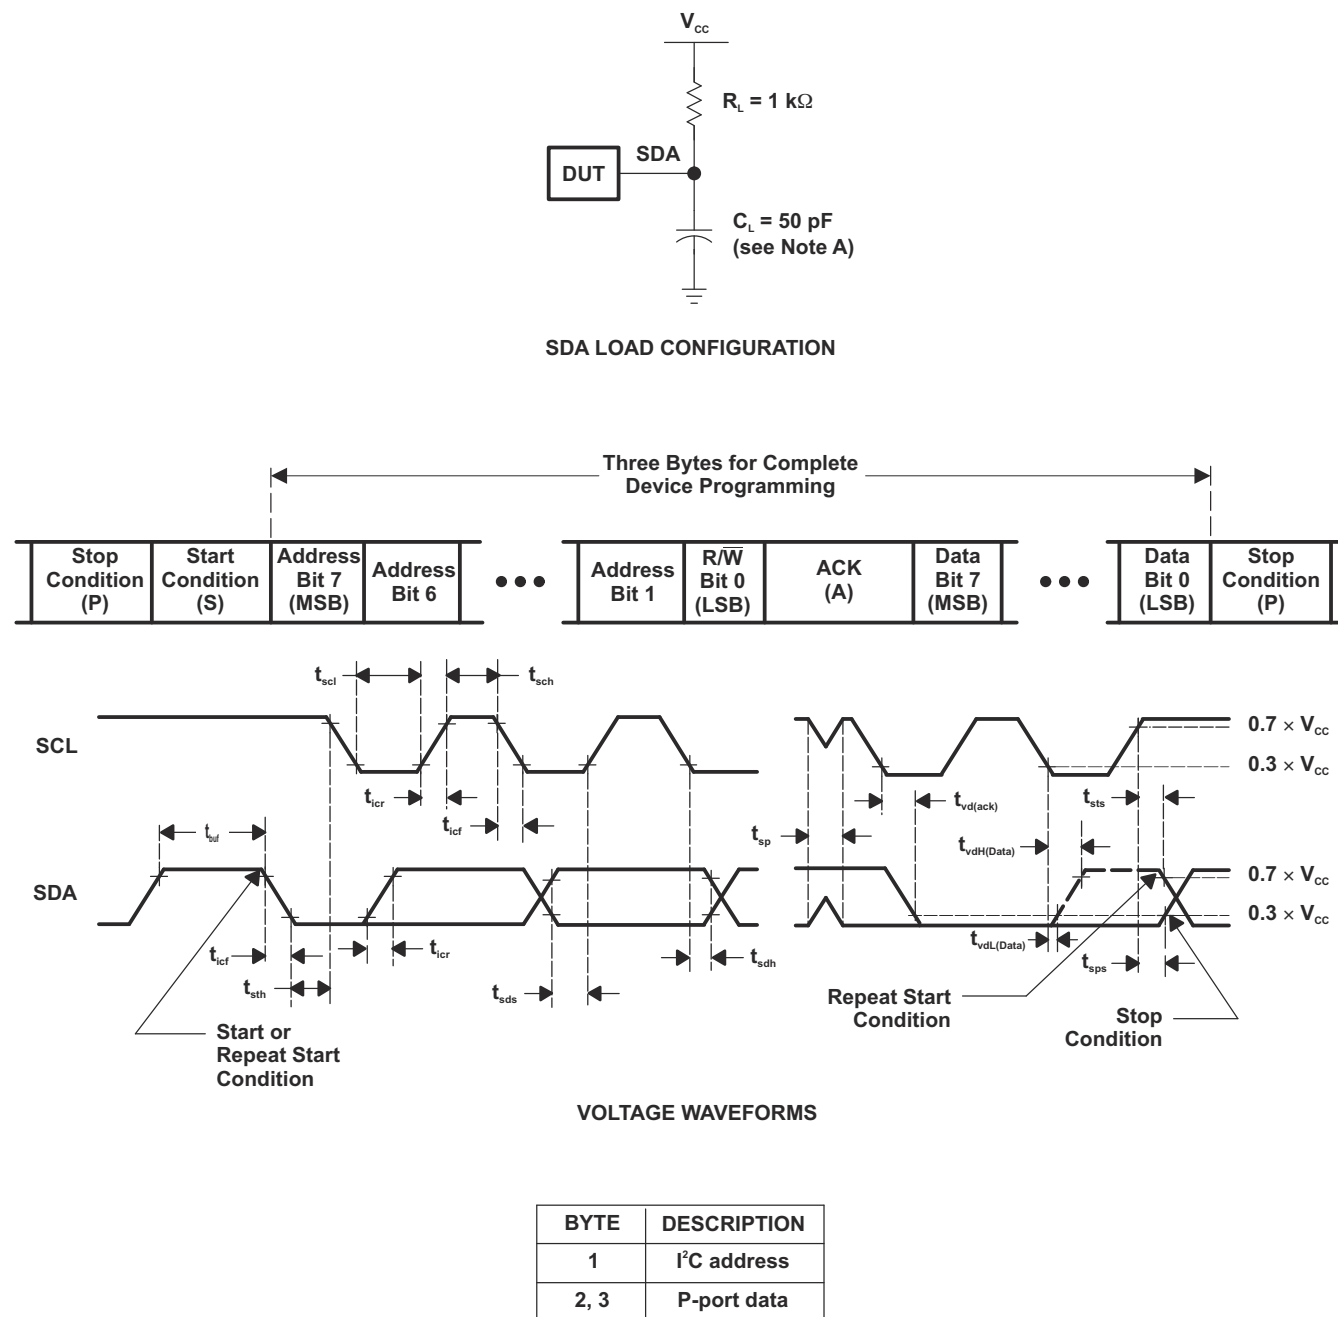

PARAMETER		FROM (INPUT)	TO (OUTPUT)	MIN	MAX	UNIT
$t_{pd}^{(1)}$	Propagation delay time	SDA or SCL	SDn or SCn	0.3	1	ns
$t_{rst}^{(2)}$	\overline{RESET} time (SDA clear)	\overline{RESET}	SDA	500		ns

- (1) The propagation delay is the calculated RC time constant of the typical ON-state resistance of the switch and the specified load capacitance, when driven by an ideal voltage source (zero output impedance).
- (2) t_{rst} is the propagation delay measured from the time the \overline{RESET} pin is first asserted low to the time the SDA pin is asserted high, signaling a stop condition. It must be a minimum of t_{WL} .

6.9 Typical Characteristics

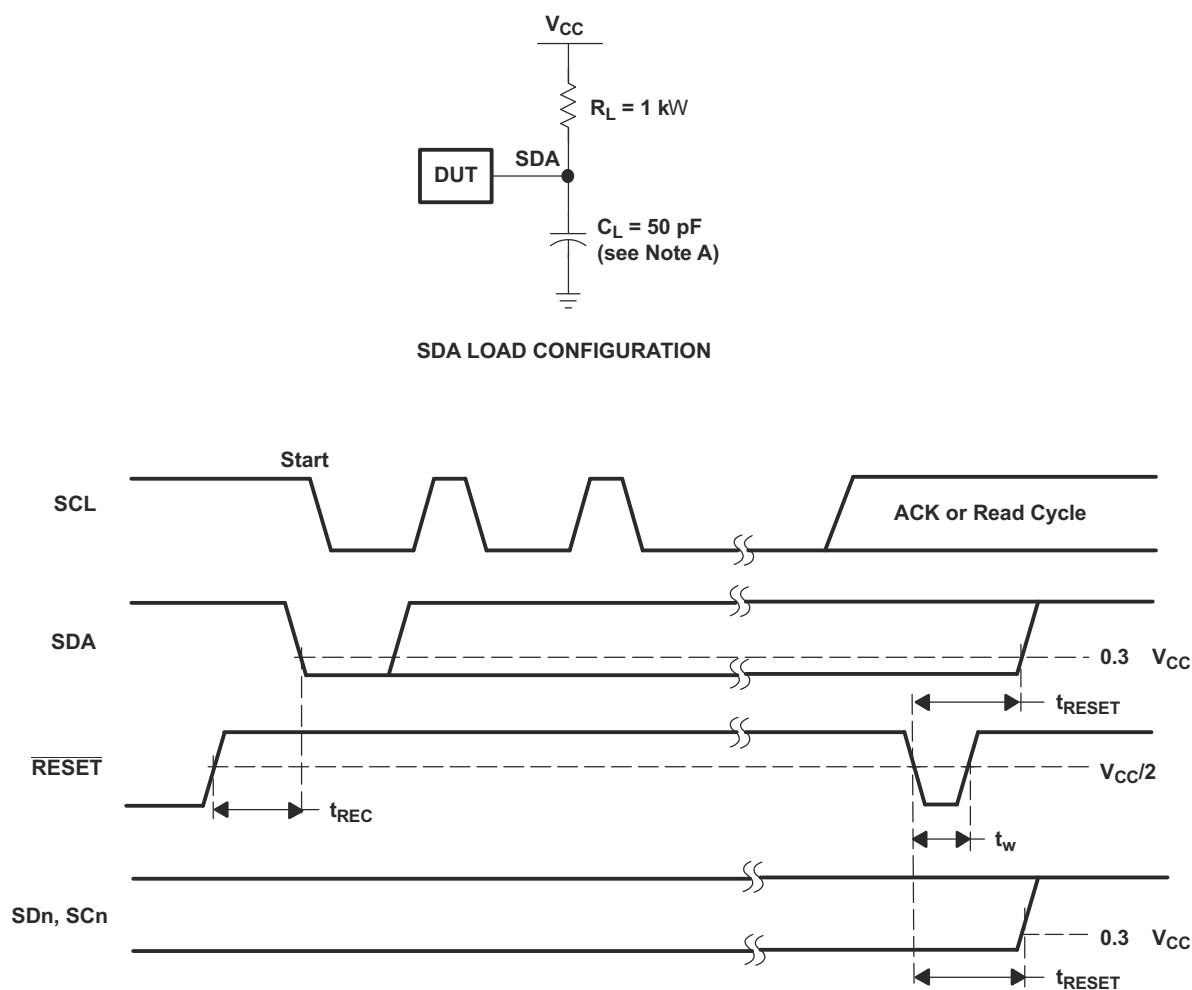

7 Parameter Measurement Information

- A. C_L includes probe and jig capacitance.
- B. All inputs are supplied by generators having the following characteristics: $PRR \leq 10 \text{ MHz}$, $Z_O = 50 \Omega$, $t_r/t_f \leq 30 \text{ ns}$.
- C. Not all parameters and waveforms are applicable to all devices.

Parameter Measurement Information (continued)

- A. C_L includes probe and jig capacitance.
- B. All inputs are supplied by generators having the following characteristics: $PRR \leq 10 \text{ MHz}$, $Z_O = 50 \Omega$, $t_r/t_f \leq 30 \text{ ns}$.
- C. I/Os are configured as inputs.
- D. Not all parameters and waveforms are applicable to all devices.

Figure 6. Reset Load Circuit and Voltage Waveforms

8 Detailed Description

8.1 Overview

The TCA9548A is an 8-channel, bidirectional translating I²C switch. The master SCL/SDA signal pair is directed to eight channels of slave devices, SC0/SD0-SC7/SD7. Any individual downstream channel can be selected as well as any combination of the eight channels.

The device offers an active-low $\overline{\text{RESET}}$ input which resets the state machine and allows the TCA9548A to recover must one of the downstream I²C buses get stuck in a low state. The state machine of the device can also be reset by cycling the power supply, V_{CC}, also known as a power-on reset (POR). Both the RESET function and a POR cause all channels to be deselected.

The connections of the I²C data path are controlled by the same I²C master device that is switched to communicate with multiple I²C slaves. After the successful acknowledgment of the slave address (hardware selectable by A0, A1, and A2 pins), a single 8-bit control register is written to or read from to determine the selected channels.

The TCA9548A may also be used for voltage translation, allowing the use of different bus voltages on each SCn/SDn pair such that 1.8-V, 2.5-V, or 3.3-V parts can communicate with 5-V parts. This is achieved by using external pull-up resistors to pull the bus up to the desired voltage for the master and each slave channel.

TCA9548A

SCPS207F –MAY 2012–REVISED NOVEMBER 2016

www.ti.com

8.2 Functional Block Diagram

8.3 Feature Description

The TCA9548A is an 8-channel, bidirectional translating switch for I²C buses that supports Standard-Mode (100 kHz) and Fast-Mode (400 kHz) operation. The TCA9548A features I²C control using a single 8-bit control register in which each bit controls the enabling and disabling of one of the corresponding 8 switch channels for I²C data flow. Depending on the application, voltage translation of the I²C bus can also be achieved using the TCA9548A to allow 1.8-V, 2.5-V, or 3.3-V parts to communicate with 5-V parts. Additionally, in the event that communication on the I²C bus enters a fault state, the TCA9548A can be reset to resume normal operation using the $\overline{\text{RESET}}$ pin feature or by a power-on reset which results from cycling power to the device.

8.4 Device Functional Modes

8.4.1 $\overline{\text{RESET}}$ Input

The $\overline{\text{RESET}}$ input is an active-low signal that may be used to recover from a bus-fault condition. When this signal is asserted low for a minimum of t_{WL} , the TCA9548A resets its registers and I²C state machine and deselects all channels. The $\overline{\text{RESET}}$ input must be connected to V_{CC} through a pull-up resistor.

8.4.2 Power-On Reset

When power is applied to the VCC pin, an internal power-on reset holds the TCA9548A in a reset condition until V_{CC} has reached V_{PORR}. At this point, the reset condition is released, and the TCA9548A registers and I²C state machine are initialized to their default states, all zeroes, causing all the channels to be deselected. Thereafter, V_{CC} must be lowered below V_{PORF} to reset the device.

8.5 Programming

8.5.1 I²C Interface

The TCA9548A has a standard bidirectional I²C interface that is controlled by a master device in order to be configured or read the status of this device. Each slave on the I²C bus has a specific device address to differentiate between other slave devices that are on the same I²C bus. Many slave devices require configuration upon startup to set the behavior of the device. This is typically done when the master accesses internal register maps of the slave, which have unique register addresses. A device can have one or multiple registers where data is stored, written, or read.

The physical I²C interface consists of the serial clock (SCL) and serial data (SDA) lines. Both SDA and SCL lines must be connected to V_{CC} through a pull-up resistor. The size of the pull-up resistor is determined by the amount of capacitance on the I²C lines. (For further details, see the [I²C Pull-up Resistor Calculation](#) application report. Data transfer may be initiated only when the bus is idle. A bus is considered idle if both SDA and SCL lines are high after a STOP condition (See [Figure 7](#) and [Figure 8](#)).

The following is the general procedure for a master to access a slave device:

1. If a master wants to send data to a slave:
 - Master-transmitter sends a START condition and addresses the slave-receiver.
 - Master-transmitter sends data to slave-receiver.
 - Master-transmitter terminates the transfer with a STOP condition.
2. If a master wants to receive or read data from a slave:
 - Master-receiver sends a START condition and addresses the slave-transmitter.
 - Master-receiver sends the requested register to read to slave-transmitter.
 - Master-receiver receives data from the slave-transmitter.

Programming (continued)

- Master-receiver terminates the transfer with a STOP condition.

Figure 7. Definition of Start and Stop Conditions

Figure 8. Bit Transfer

8.5.2 Device Address

Figure 9 shows the address byte of the TCA9548A.

Figure 9. TCA9548A Address

Programming (continued)

The last bit of the slave address defines the operation (read or write) to be performed. When it is high (1), a read is selected, while a low (0) selects a write operation.

[Table 1](#) shows the TCA9548A address reference.

Table 1. Address Reference

INPUTS			I ² C BUS SLAVE ADDRESS
A2	A1	A0	
L	L	L	112 (decimal), 70 (hexadecimal)
L	L	H	113 (decimal), 71 (hexadecimal)
L	H	L	114 (decimal), 72 (hexadecimal)
L	H	H	115 (decimal), 73 (hexadecimal)
H	L	L	116 (decimal), 74 (hexadecimal)
H	L	H	117 (decimal), 75 (hexadecimal)
H	H	L	118 (decimal), 76 (hexadecimal)
H	H	H	119 (decimal), 77 (hexadecimal)

8.5.3 Bus Transactions

Data must be sent to and received from the slave devices, and this is accomplished by reading from or writing to registers in the slave device.

Registers are locations in the memory of the slave which contain information, whether it be the configuration information or some sampled data to send back to the master. The master must write information to these registers in order to instruct the slave device to perform a task.

While it is common to have registers in I²C slaves, note that not all slave devices have registers. Some devices are simple and contain only 1 register, which may be written to directly by sending the register data immediately after the slave address, instead of addressing a register. The TCA9548A is example of a single-register device, which is controlled via I²C commands. Since it has 1 bit to enable or disable a channel, there is only 1 register needed, and the master merely writes the register data after the slave address, skipping the register number.

8.5.3.1 Writes

To write on the I²C bus, the master sends a START condition on the bus with the address of the slave, as well as the last bit (the R/ \overline{W} bit) set to 0, which signifies a write. The slave acknowledges, letting the master know it is ready. After this, the master starts sending the control register data to the slave until the master has sent all the data necessary (which is sometimes only a single byte), and the master terminates the transmission with a STOP condition.

There is no limit to the number of bytes sent, but the last byte sent is what is in the register.

[Figure 10](#) shows an example of writing a single byte to a slave register.

Write to one register in a device

Figure 10. Write to Register

8.5.3.2 Reads

Reading from a slave is very similar to writing, but the master sends a START condition, followed by the slave address with the R/W bit set to 1 (signifying a read). The slave acknowledges the read request, and the master releases the SDA bus but continues supplying the clock to the slave. During this part of the transaction, the master becomes the master-receiver, and the slave becomes the slave-transmitter.

The master continues to send out the clock pulses, but releases the SDA line so that the slave can transmit data. At the end of every byte of data, the master sends an ACK to the slave, letting the slave know that it is ready for more data. Once the master has received the number of bytes it is expecting, it sends a NACK, signaling to the slave to halt communications and release the bus. The master follows this up with a STOP condition.

Figure 11 shows an example of reading a single byte from a slave register.

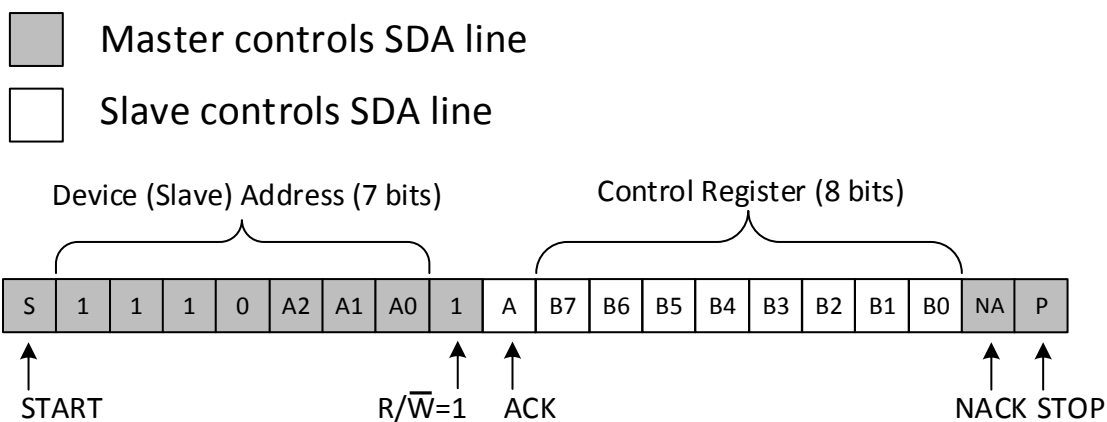

Figure 11. Read from Control Register

8.5.4 Control Register

Following the successful acknowledgment of the address byte, the bus master sends a command byte that is stored in the control register in the TCA9548A (see [Figure 12](#)). This register can be written and read via the I²C bus. Each bit in the command byte corresponds to a SCn/SDn channel and a high (or 1) selects this channel. Multiple SCn/SDn channels may be selected at the same time. When a channel is selected, the channel becomes active after a stop condition has been placed on the I²C bus. This ensures that all SCn/SDn lines are in a high state when the channel is made active, so that no false conditions are generated at the time of connection. A stop condition always must occur immediately after the acknowledge cycle. If multiple bytes are received by the TCA9548A, it saves the last byte received.

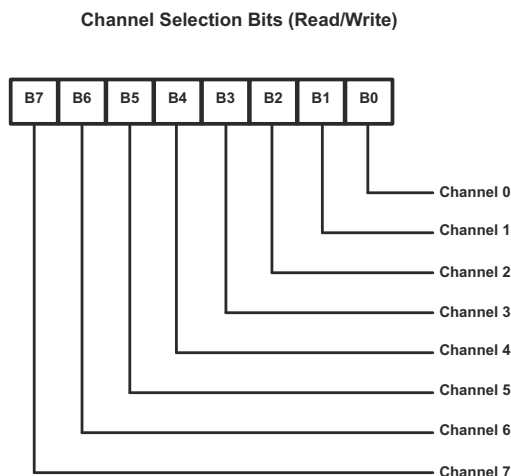

Figure 12. Control Register

[Table 2](#) shows the TCA9548A Command Byte Definition.

Table 2. Command Byte Definition

CONTROL REGISTER BITS								COMMAND
B7	B6	B5	B4	B3	B2	B1	B0

	1							Channel 6 enabled
0	X	X	X	X	X	X	X	Channel 7 disabled
1								Channel 7 enabled
0	0	0	0	0	0	0	0	No channel selected, power-up/reset default state

8.5.5 $\overline{\text{RESET}}$ Input

The $\overline{\text{RESET}}$ input is an active-low signal that may be used to recover from a bus-fault condition. When this signal is asserted low for a minimum of t_{WL} , the TCA9548A resets its registers and I²C state machine and deselects all channels. The $\overline{\text{RESET}}$ input must be connected to V_{CC} through a pull-up resistor.

8.5.6 Power-On Reset

When power (from 0 V) is applied to V_{CC} , an internal power-on reset holds the TCA9548A in a reset condition until V_{CC} has reached V_{POR} . At that point, the reset condition is released and the TCA9548A registers and I²C state machine initialize to their default states. After that, V_{CC} must be lowered to below V_{POR} and then back up to the operating voltage for a power-reset cycle.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

Applications of the TCA9548A contain an I²C (or SMBus) master device and up to eight I²C slave devices. The downstream channels are ideally used to resolve I²C slave address conflicts. For example, if eight identical digital temperature sensors are needed in the application, one sensor can be connected at each channel: 0-7. When the temperature at a specific location needs to be read, the appropriate channel can be enabled and all other channels switched off, the data can be retrieved, and the I²C master can move on and read the next channel.

In an application where the I²C bus contains many additional slave devices that do not result in I²C slave address conflicts, these slave devices can be connected to any desired channel to distribute the total bus capacitance across multiple channels. If multiple switches are enabled simultaneously, additional design requirements must be considered (see the [Design Requirements](#) section and [Detailed Design Procedure](#) section).

9.2 Typical Application

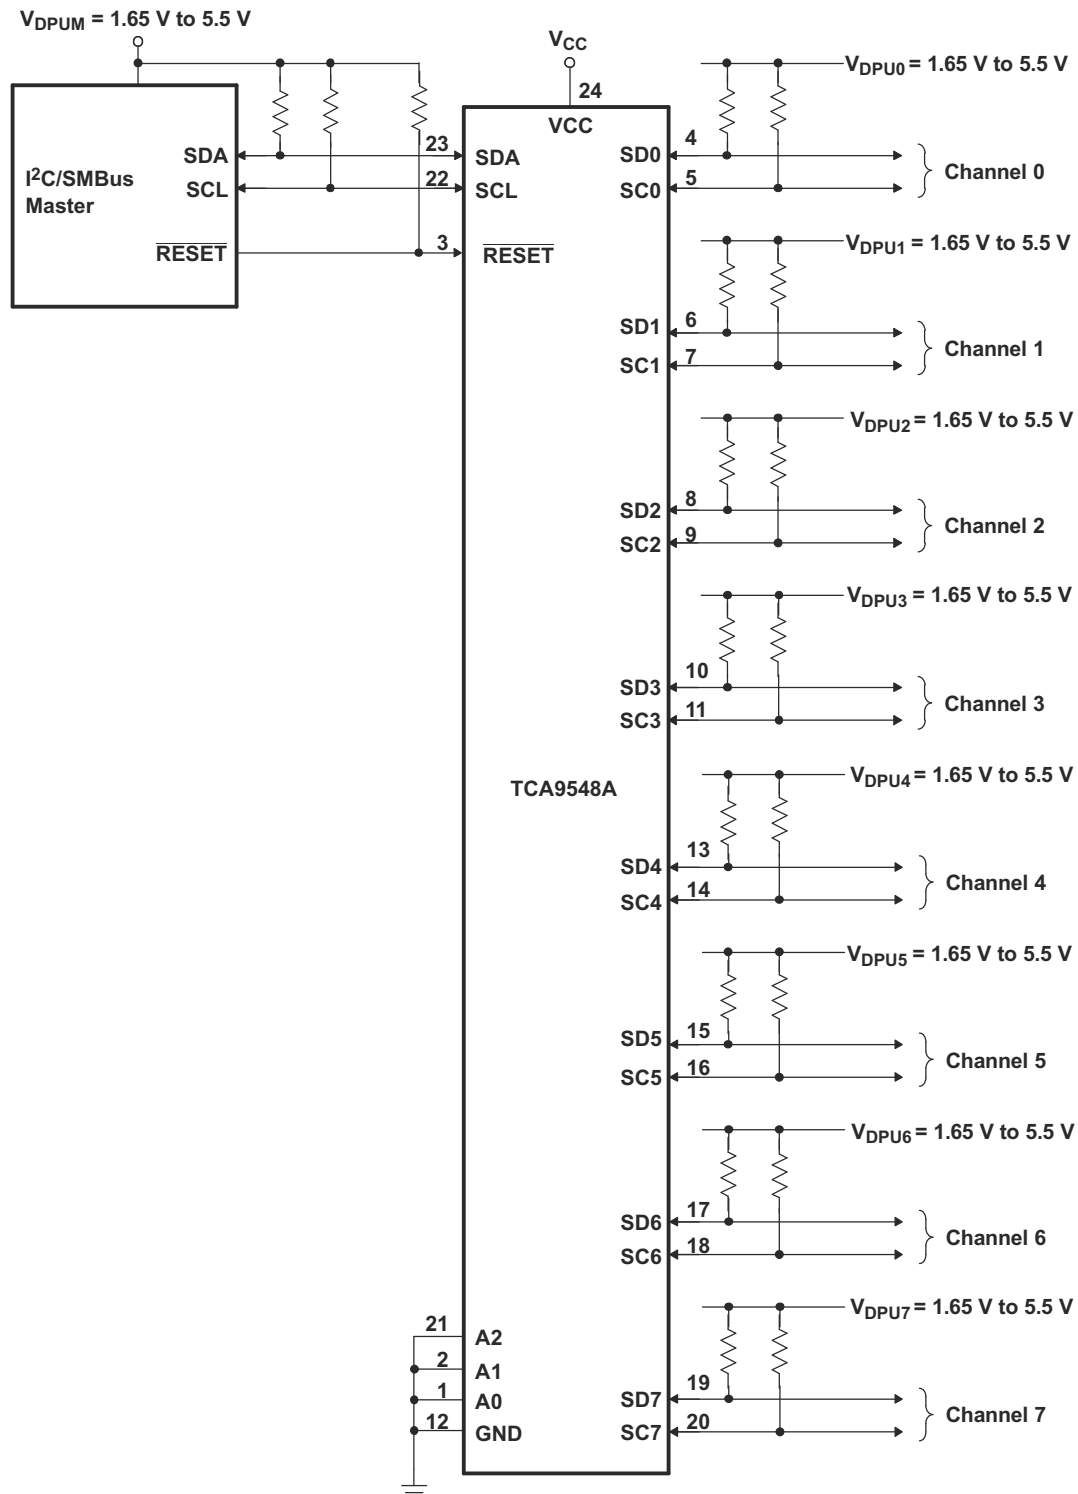

[Figure 13](#) shows an application in which the TCA9548A can be used.

TCA9548A

SCPS207F –MAY 2012–REVISED NOVEMBER 2016

www.ti.com

Typical Application (continued)

Pin numbers shown are for the PW package.

Figure 13. Typical Application Schematic

Typical Application (continued)

9.2.1 Design Requirements

A typical application of the TCA9548A contains one or more data pull-up voltages, V_{DPUX} , one for the master device (V_{DPUM}) and one for each of the selectable slave channels ($V_{DPU0} - V_{DPU7}$). In the event where the master device and all slave devices operate at the same voltage, then $V_{DPUM} = V_{DPUX} = V_{CC}$. In an application where voltage translation is necessary, additional design requirements must be considered to determine an appropriate V_{CC} voltage.

The A0, A1, and A2 pins are hardware selectable to control the slave address of the TCA9548A. These pins may be tied directly to GND or V_{CC} in the application.

If multiple slave channels are activated simultaneously in the application, then the total I_{OL} from SCL/SDA to GND on the master side is the sum of the currents through all pull-up resistors, R_p .

The pass-gate transistors of the TCA9548A are constructed such that the V_{CC} voltage can be used to limit the maximum voltage that is passed from one I²C bus to another.

Figure 14 shows the voltage characteristics of the pass-gate transistors (note that the graph was generated using data specified in the [Electrical Characteristics](#) table). In order for the TCA9548A to act as a voltage translator, the V_{pass} voltage must be equal to or lower than the lowest bus voltage. For example, if the main bus is running at 5 V and the downstream buses are 3.3 V and 2.7 V, V_{pass} must be equal to or below 2.7 V to effectively clamp the downstream bus voltages. As shown in Figure 14, $V_{pass(max)}$ is 2.7 V when the TCA9548A supply voltage is 4 V or lower, so the TCA9548A supply voltage could be set to 3.3 V. Pull-up resistors then can be used to bring the bus voltages to their appropriate levels (see Figure 13).

9.2.2 Detailed Design Procedure

Once all the slaves are assigned to the appropriate slave channels and bus voltages are identified, the pull-up resistors, R_p , for each of the buses need to be selected appropriately. The minimum pull-up resistance is a function of V_{DPUX} , $V_{OL(max)}$, and I_{OL} as shown in Equation 1:

$$R_{p(min)} = \frac{V_{DPUX} - V_{OL(max)}}{I_{OL}} \quad (1)$$

The maximum pull-up resistance is a function of the maximum rise time, t_r (300 ns for fast-mode operation, $f_{SCL} = 400$ kHz) and bus capacitance, C_b as shown in Equation 2:

$$R_{p(max)} = \frac{t_r}{0.8473 \times C_b} \quad (2)$$

The maximum bus capacitance for an I²C bus must not exceed 400 pF for fast-mode operation. The bus capacitance can be approximated by adding the capacitance of the TCA9548A, $C_{io(OFF)}$, the capacitance of wires, connections and traces, and the capacitance of each individual slave on a given channel. If multiple channels are activated simultaneously, each of the slaves on all channels contribute to total bus capacitance.

Typical Application (continued)

9.2.3 Application Curves

10 Power Supply Recommendations

The operating power-supply voltage range of the TCA9548A is 1.65 V to 5.5 V applied at the VCC pin. When the TCA9548A is powered on for the first time or anytime the device must be reset by cycling the power supply, the power-on reset requirements must be followed to ensure the I²C bus logic is initialized properly.

10.1 Power-On Reset Requirements

In the event of a glitch or data corruption, TCA9548A can be reset to its default conditions by using the power-on reset feature. Power-on reset requires that the device go through a power cycle to be completely reset. This reset also happens when the device is powered on for the first time in an application.

A power-on reset is shown in Figure 17.

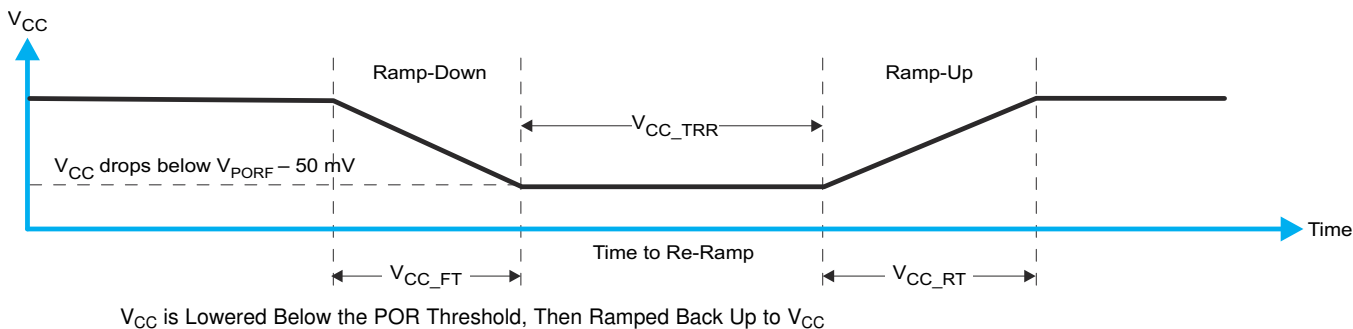

Figure 17. Power-On Reset Waveform

Table 3 specifies the performance of the power-on reset feature for TCA9548A for both types of power-on reset.

Table 3. Recommended Supply Sequencing and Ramp Rates⁽¹⁾

PARAMETER			MIN	MAX	UNIT
V _{CC_FT}	Fall time	See Figure 17	1	100	ms
V _{CC_RT}	Rise time	See Figure 17	0.1	100	ms
V _{CC_TRR}	Time to re-ramp (when V _{CC} drops below V _{PORF(min)} – 50 mV or when V _{CC} drops to GND)	See Figure 17	40		μs
V _{CC_GH}	Level that V _{CC} can glitch down to, but not cause a functional disruption when V _{CC_GW} = 1 μs	See Figure 18		1.2	V
V _{CC_GW}	Glitch width that does not cause a functional disruption when V _{CC_GH} = 0.5 × V _{CC}	See Figure 18		10	μs

(1) All supply sequencing and ramp rate values are measured at T_A = 25°C

Glitches in the power supply can also affect the power-on reset performance of this device. The glitch width (V_{CC_GW}) and height (V_{CC_GH}) are dependent on each other. The bypass capacitance, source impedance, and device impedance are factors that affect power-on reset performance. Figure 18 and Table 3 provide more information on how to measure these specifications.

Figure 18. Glitch Width and Glitch Height

V_{POR} is critical to the power-on reset. V_{POR} is the voltage level at which the reset condition is released and all the registers and the I²C/SMBus state machine are initialized to their default states. The value of V_{POR} differs based on the V_{CC} being lowered to or from 0. [Figure 19](#) and [Table 3](#) provide more details on this specification.

Figure 19. V_{POR}

11 Layout

11.1 Layout Guidelines

For PCB layout of the TCA9548A, common PCB layout practices must be followed but additional concerns related to high-speed data transfer such as matched impedances and differential pairs are not a concern for I²C signal speeds. It is common to have a dedicated ground plane on an inner layer of the board and pins that are connected to ground must have a low-impedance path to the ground plane in the form of wide polygon pours and multiple vias. By-pass and de-coupling capacitors are commonly used to control the voltage on the VCC pin, using a larger capacitor to provide additional power in the event of a short power supply glitch and a smaller capacitor to filter out high-frequency ripple.

In an application where voltage translation is not required, all V_{DPUX} voltages and V_{CC} could be at the same potential and a single copper plane could connect all of pull-up resistors to the appropriate reference voltage. In an application where voltage translation is required, V_{DPU0} and V_{DPU0} – V_{DPU7}, may all be on the same layer of the board with split planes to isolate different voltage potentials.

To reduce the total I²C bus capacitance added by PCB parasitics, data lines (SC_n and SD_n) must be as short as possible and the widths of the traces must also be minimized (for example, 5-10 mils depending on copper weight).

12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TCA9548AMRGER	ACTIVE	VQFN	RGE	24	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	PW548A	Samples
TCA9548APWR	ACTIVE	TSSOP	PW	24	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 85	PW548A	Samples
TCA9548ARGER	ACTIVE	VQFN	RGE	24	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	PW548A	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

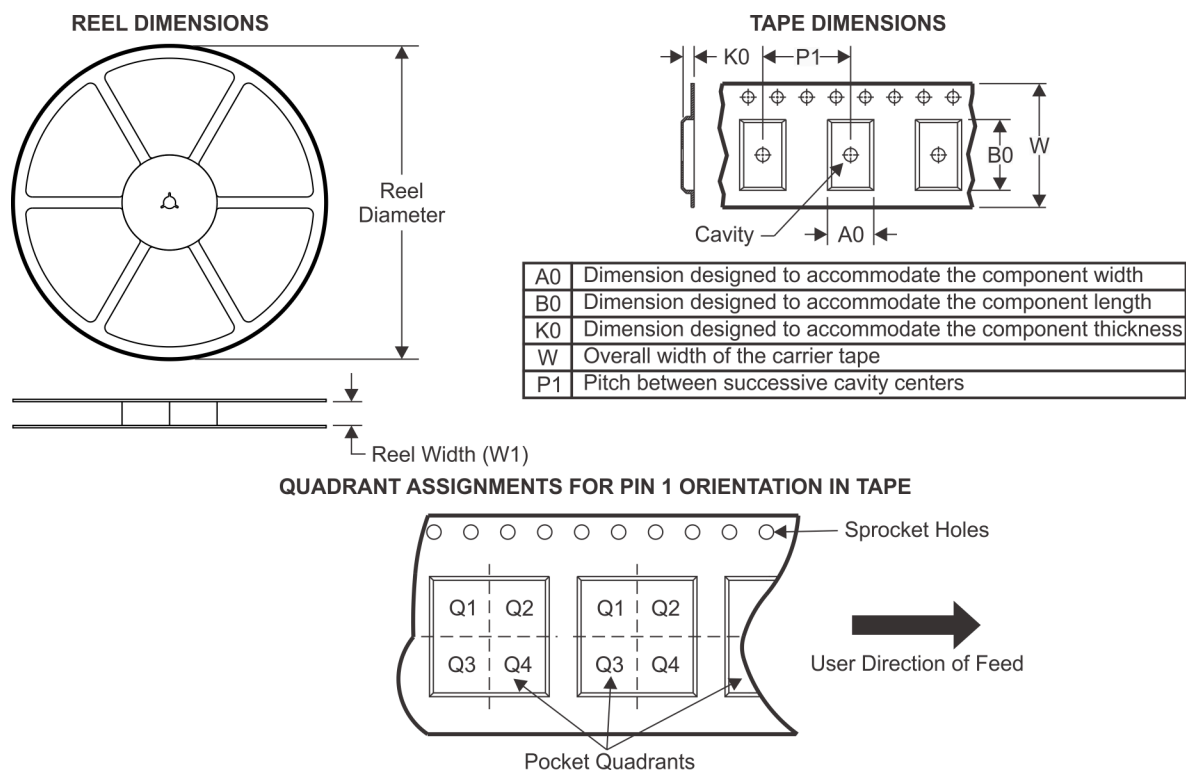

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
